

Developing Qt Desktop Applications in Python

Nemanja Mićović

Introduction

About Me

- Teaching assistant at Faculty of Mathematics
- AI Research Scientist at Nordeus
- I like:
 - Artificial Intelligence
 - Machine Learning
 - Education and Learning
 - GNU/Linux and open source
 - Python
 - Epic and sciency fiction
 - Video games!
- My [veb](#) webpage

- Founded over 11 years ago , now with 170+ employee from more than 20 countries
- Published games:
 - [Top Eleven](#):
 - over 230 million of registered users
 - Jose Mourinho is the face of TE
 - 11 years of being one of the most popular mobile sports games
 - [Golden Boot](#) (over 65 million players played so far)
 - [Heroic](#) (Unite talks: [1](#), [2](#), [3](#), [4](#), [5](#))
- ML/AI team:
 - Researches and applies AI algorithms for the needs of our games
- Visit our [ML/AI blog](#)!
- We are hiring, check out open positions [here](#)!

Desktop Apps

- Not easy to actually **define** :)
- But let's say these are *classical* programs that we run on our PCs and Macs
- We mostly interact through them via mouse and keyboard
- Native Desktop apps are Desktop apps created for the platform (Windows for example) in adequate technology (DotNet)
- Native apps often look very similar (due to sharing internal tech) - for example, same button style and animations
- Examples: Adobe Photoshop, Unity, GIMP, Dolphin, KDenLive. . .

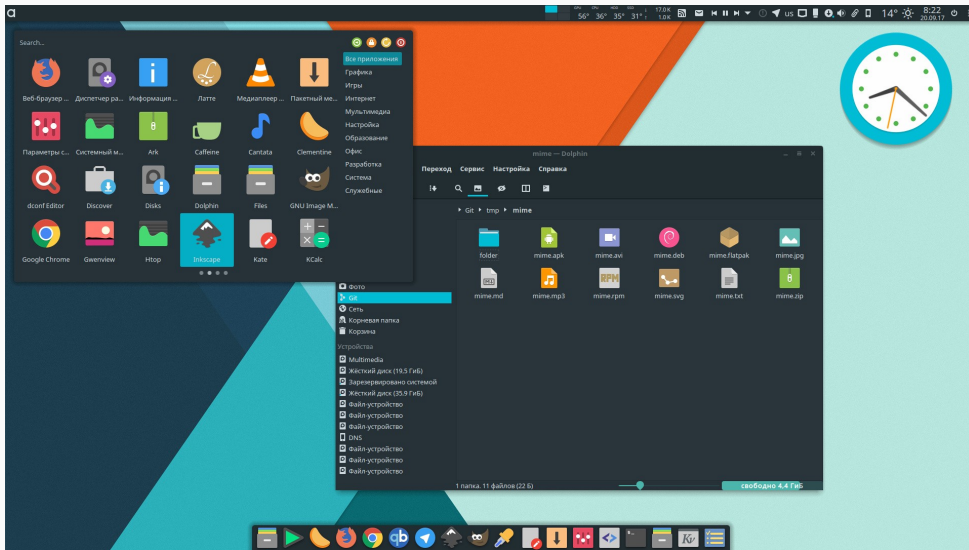

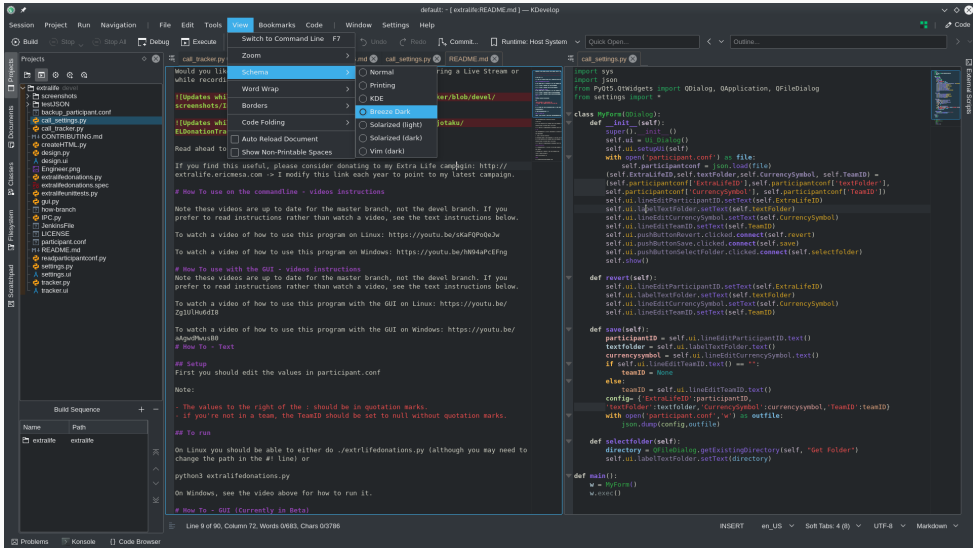

- Due to rapid growth of Web technology, it's also possible to create Desktop apps
- Probably most popular framework is [Electron](#)
- It allows us to bundle Node based apps into packages that resemble Desktop apps
- Atom, Slack, Twitch and VSCode are great examples

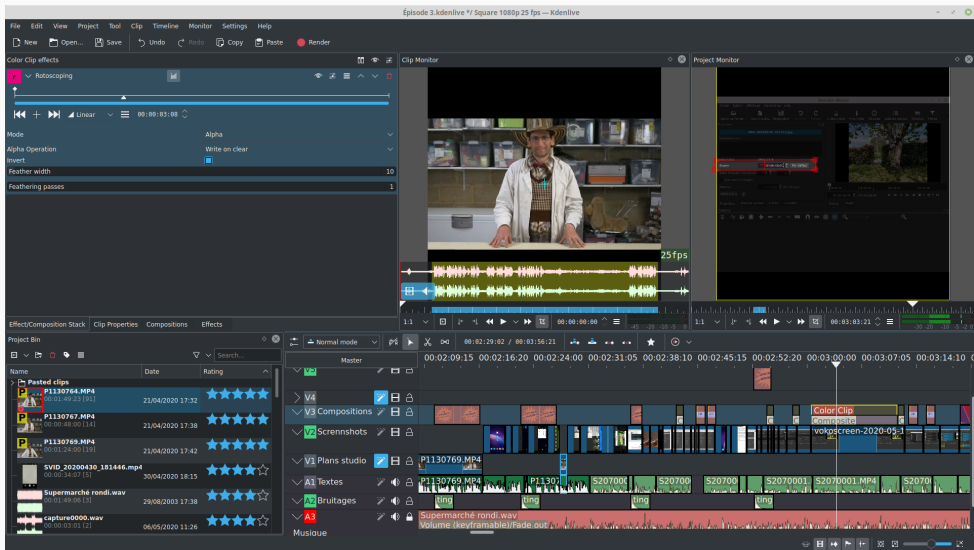

- C++ Framework for creating programs that support multiple platforms
- Initial releases was way back in 1995
- Current stable version is 6.0.3
- One of the larger available frameworks for C++
- KDE organization uses Qt for lots of their projects (KDE Plasma, Konsole, Kate, KDevelop, KDenLive, Dolphin...)

KDE Plasma

- There are extension packages that allow you to use Qt from inside Python
- PyQt5 is one of the most popular ones
- This is one of our goals for today!

Deploying Python Qt based applications

- How do we **build** an app if we use Python?
- [fman](#) is a good solution!
- It was originally made for `fman` file browser (developed in Python and Qt)
- You can find the tutorial [here](#)

Plan for today (live coding)

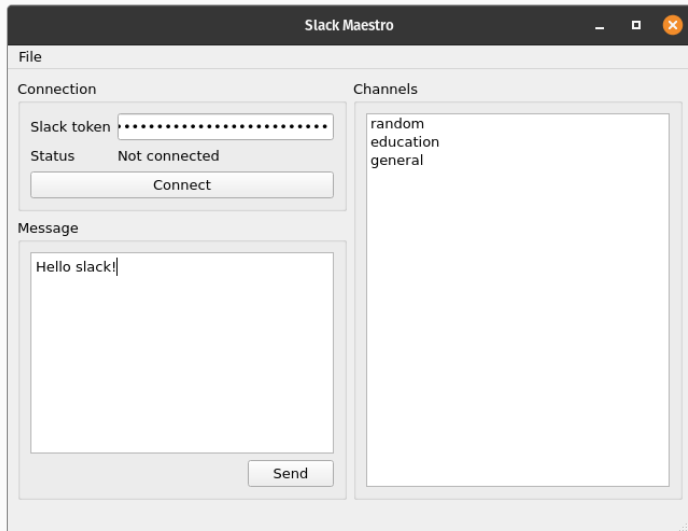

Example 01

- Slack bot frontend
- Demonstrates how we build UI
- Demonstrates signals and slots

Example 02

- Style GAN frontend (we shall generate dog images!)
- Demonstrates QThread
- Demonstrates signals and slots

Example 01

Example 02

Where do I find the code and slides?

- You can find it [here](#)
- And here: `https://github.com/termNinja/pytalk2021-pyqt-desktop`

Thanks for your attention!
